2 PURPOSE OF TEST

The Series 16 System Exerciser tests a complete 16 bit system with CPU, memory, I/O devices, selector channels, and other options running simultaneously. The exerciser is not designed to detect specific failures in any device; but, it detects failures caused by the interactions between elements of the system.

3 MINIMUM HARDWARE REQUIRED

The following lists the minimum hardware required to run this test:

- 16-bit Processor
- Minimum 32kb memory
- A console Teletype type device, GDT, CRT, PET 1100, or Carousel 15, 30, or 35 on a current loop interface; or a GDT, CRT, PET 1100, PET 1200, or Carousel 15, 30, 35, or 300 on a PASLA or PALM interface.

Optional multiplexor bus devices:

- display panel - M71-101 or M71-102
- universal clock module - M48-000
- paper-tape reader or reader/punch - M46-205 interface
- card reader - M46-235 interface
- two line printers - M46-202 or M46-206 interface
- intertape cassette system - M46-400 (four drives may be tested simultaneously)
- floppy media disc system (four drives may be tested simultaneously)
- model 5/16 external clock
- universal logic interface - M48-013 - requires 17-200 test cable
- digital multiplexor - requires one or more input modules, one or more output modules,and the SK-523 test fixture
- eight-line interrupt module - M48-001 - requires removal of the 17-170 cable on the front of the board
- memory protect controller

Optional selector channel devices configured in any combination on a maximum of four M73-105 or M81-115 selector channels:

- 9 track, 800 or 1600 bpi magnetic tape transports M46-470 or M46-475 controller.(Four drives on any combination of controllers can be tested simultaneously.)

- 2.5 or 10 Mb removable cartridge disc system, M46-420 or M46-421 controller.(Four drives on any combination of controllers can be tested simultaneously.)

- 40 Mb removable cartridge disc system, M46-433 controller (Four drives can be tested simultaneously.)

- 67 or 256 Mb MSM disc system.(Four drives can be tested simultaneously.)

- SELCH tester

4 REQUIREMENTS OF MACHINE UNDER TEST

This program assumes that the CPU, memory, and each peripheral device were individually checked using the appropriate test program.

If the system has more than 64kb of memory, the 8/16E memory bank scheme with a maximum address range of 256kb is assumed.

A card reader test deck must be used to check the card reader (06-159M44R02). See Appendix E for a description of the test deck.

If no high-speed, paper-tape punch is present on the system, a test paper tape (06-136F01M14) must be provided if the HSPTR is to be tested.

5 LOADING PROCEDURE

Tape Format:

The 06-136M17 tape is an absolute, nonzoned memory image tape with a front-end bootloader.

Normal Loading Procedure:

1. Manually enter the X'50' sequence shown below into memory:

LOCATION	CONTENTS	
X'30'	X'0000'	
X'32'	X'0000'	
X'34'	X'0000'	
X'36'	X'0050'	
X'50'	X'D500'	
X'52'	X'00CF'	
X'54'	X'4300'	
X'56'	X'0080'	
X'78'	X'0294'	For TTY or Carousel 35
X'78'	X'C092'	For micro I/O bus
X'78'	X'0399'	For HSPTR
X'78'	X'1399'	For HSPTR/P

2. Place the program tape in the tape reader.

3. Execute at address X'30'.

4. When the processor halts, observe the CHKSUM byte displayed on processor display indicator D1. If it is zero, loading is complete; if it is not zero, repeat the loading procedure.

Multimedia Diagnostic Loading Procedure:

To load this program from the Interdata Multimedia Diagnostic System, refer to Publication Number 06-176A15.

Program Execution:

After successfully loading the program, if the console device is a TTY, GDT, CRT, PET 1100, or Carousel 15, 30, or 35 on a current loop interface with device number X'02', press RUN (EXEcute) to begin execution.

If the console device is different, refer to Appendix A and set up the parameters for the console I/O device. Address location X'2D0' and start program execution. The following title is output to the console device:

```
SERIES 16 SYSTEM EXERCISER 06-136R04

*
```

The exerciser can be restarted at address X'2D4'. This bypasses some initialization and preserves the device control blocks (DCBs) of previously selected devices. The following message is output:

```
RESTART
*
```

6 OPERATING PROCEDURES

The Series 16 System Exerciser consists of two major tasks: the command processor and the device dispatcher. The command processor communicates with the operator to build the tables and data structures used by the device dispatcher.

The command processor is entered when the program is initially started at X'2D0' or restarted at X'2D4'. The command processor is also entered whenever the device dispatcher terminates. An asterisk character (*) is output to the console device to indicate that commands can be entered. See Appendix B for the command syntax. The RUN command causes the command processor to pass control to the device dispatcher.

The device dispatcher repeatedly polls the device service table in an attempt to keep all selected devices busy. The dispatcher terminates for any of the following reasons:

- The operator depresses the break key on the console device.
- Machine malfunction interrupt.
- An error is detected and the HLT option is selected.
- The error queue overflows.
- An unrecoverable error occurs. (See Appendix F.)

Normal Testing:

1. All devices to be tested are placed on the device service table (DST) using the device selection commands listed in Appendix C.

2. When you select a device for testing that uses a selector channel, you can also choose to let that device use the movable buffer. To make that assignment, the command immediately following the device selection command must be:

   *MOVE (CR)

   A maximum of 12 devices can be assigned to use the movable buffer. Attempting to assign more than 12 devices results in an error message. Each device, in the order that the assignments were made, are given access to use the movable buffer instead of its normal input buffer. The movable buffer starts at the first 1kb boundary above the exerciser. After each use, it moves up 1kb. When the top of memory is reached, the device loses control of the movable buffer and resorts back to its own input buffer. The movable buffer is then given to the next device chosen.

   When the movable buffer is active, the memory test driver automatically skips the 1kb segment where the movable buffer currently is.

3. Program options and feature tests (e.g., halt on error, single-precision floating-point) are selected using the program control commands listed in Appendix D.

4. Verify the proper device selection and parameter values using the DST list command.

5. Verify the proper options and feature selections using the OPT list command.

6. Use the RUN command to begin testing. All testing is done under interrupt control. If background testing is selected, the following tests are executed one time for each pass through the device service table:

   - illegal instruction interrupt test
   - simulate interrupt test
   - SVC interrupt test
   - fixed-point arithmetic test
   - single-precision, floating-point test (if option FLT is selected)
   - double-precision, floating-point test (if option DFLT is selected)
   - load multiple, store multiple test

7. The display panel is used to indicate testing on those devices or features that cannot be visually observed. See Appendix G for the meaning of each bit. A count is displayed in the display's top half. The count increments by one each pass through the device service table.

8. Press the break key on the console device to terminate testing.

9. Devices can be added or deleted from the device service table at this time. Return to Step 1.

Optional Testing:

Polling all devices while awaiting their interrupts is accomplished with the PSW enabling the following interrupts:

- immediate interrupt (PSW bits 1 and 4 set)
- machine malfunction (PSW bit 2 set)
- fixed-point arithmetic fault (PSW bit 3 set)
- floating-point fault (PSW bit 5 set)

The user can change this PSW by changing location DSPCHER. Machine malfunction, fixed-point arithmetic, and floating point interrupts can be disabled through this means. If fixed point arithmetic fault is disabled, errors are generated unless floating point testing is disabled or background testing is disabled. The immediate interrupt cannot be disabled.

During testing, whenever error messages are not being printed, an echo test is running on the console. Pressing any key other than break should cause the corresponding character to be typed.

Error Procedures:

When the program detects an error during testing:

1. The error counter in the offending device's DCB is incremented.

2. If the LOG option is set and the bad status bit in the device's DCB equals zero, an error message is placed on the error queue.

3. The bad status bit and the not counting bit in the device's DCB are set.

4. If the HLT option is set or if the error queue is full, testing is aborted.

5. If testing is not aborted, testing continues from where the error occurred. If the error is considered unrecoverable, testing is aborted.

6. If testing is aborted, the error queue is printed, and control is given to the command processor.

If a machine malfunction interrupt is detected, an error message is placed in the error queue and the processor is halted. When the RUN switch on the display panel is depressed, the error message is output, and control is given to the command processor.

An unexpected illegal instruction interrupt causes an error message to be placed on the error queue. The message is output, and control is given to the command processor.

An unformatted cartridge causes SELCH write address failure (error 41) on the disc. The status given for a SELCH read or write address failure (errors 40 and 41) is the SELCH status, not the device status.

7 PROGRAMMING NOTES

All testing is done under interrupt control. The exerciser is based on the Series 32 System Exerciser. Its logic flow is simple so hardware debugging is as easy as possible. The operator can select up to 32 devices for testing at a given time. The selected devices are continuously tested until operator intervention. Tests can then be added or deleted to enable the operator to narrow interaction problems. The exerciser is designed to create a maximum amount of processor and I/O interrupt activity within a given time period with the hope that any potential interaction problems, not discovered by the processor test or individual peripheral tests, are found.

7.1 PERIPHERAL DRIVERS

Each peripheral driver is designed to meaningfully test the device's data transfer function under interrupt control. Thorough device testing is left to the individual device test program.

Each peripheral driver in the system exerciser consists of a number of phases. Each phase is an independent software routine representing a logical operation between the processor and the device under test. Separate phases check the status of the device, start an I/O operation, and handle interrupts. Special phases check selector channel data transfer termination addresses and make transferred data validity checks.

When an error is encountered, subroutines ERRORLOG and QUEUECHK enter the error message on the error queue, and the next logical phase is not entered. With the disc, magnetic tape, and cassette drivers, an attempt is made to restart the entire driver. In any case, the driver cannot continue until the trouble is cleared. The bad status bit is set in the device control block to discontinue reporting the same error over and over. When the trouble is cleared, the bad status bit resets and the driver continues.

7.2 DEVICE CONTROL BLOCK

When a device is selected through the command processor, the address of a device control block (DCB) is placed on the device service table. Each device has its own DCB and input buffer. The DCB contains all information needed to service a device. All device drives are reentrant and use the DCB for any necessary working storage. To add support for an additional device of any type, only provide a DCB and an input buffer. The address of the DCB should be placed in the DEV2DCB table.

To simplify this task, one special entry has already been placed in the DEV2DCB table. The mnemonic for this entry is SPCL, meaning special device, and it references a partially filled in DCB at the top of the exerciser. See the listing for details.

All references to the DCB are symbolic offsets from the start of the DCB. EQUate statements at the beginning of the program define these offsets. Not all of the fields are appropriate to all devices. Figure 1 shows the DCB format.

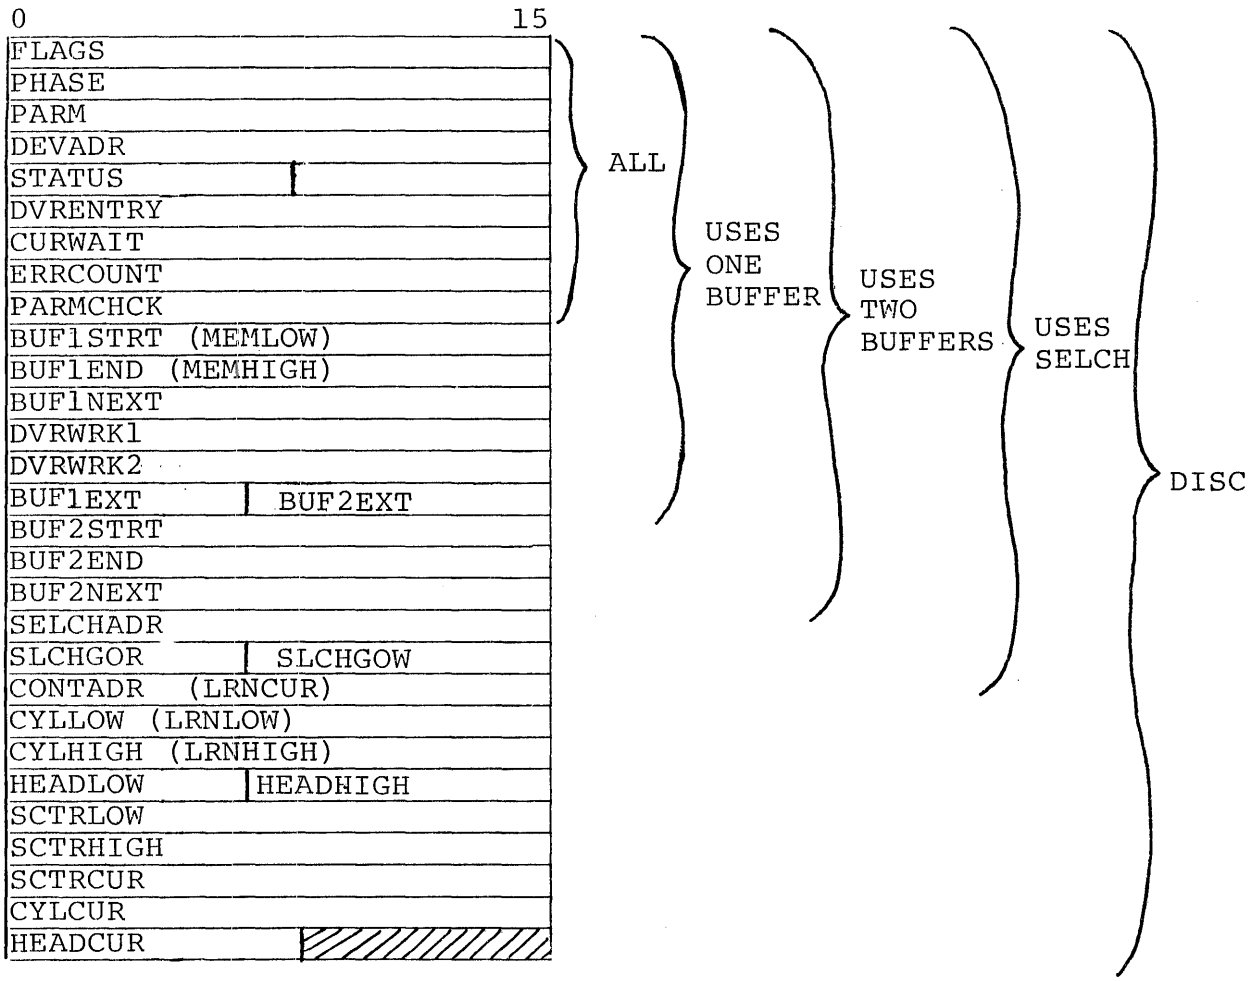

Figure 1 Device Control Block Format

The DCB FLAG halfword contains single bit flags defined as:

BIT	NAME	DESCRIPTION
0	IGNORE	0 Performs action indicated by other flags. 1 Dispatcher should bypass this device.
1	BUSY	0 Available for dispatching 1 If IGNORE = 0, interrupt is pending.
2	NOTCOUNT	0 Enables counting of dispatcher or wait passes. 1 Disable counting. Should be used with caution for long operations such as magnetic tape rewind.
3	BADSTAT	0 Sense status returned good status. 1 Error condition. Bit is set and tested by error routines. Bit is cleared by the driver. Transition from 0 to 1 causes error message print.
4	DEVCNTL1	Only significant to the driver. It is manipulated by the driver and the parameter check routine.
5	DEVCNTL2	Only significant to the driver. It is manipulated by the driver and the parameter check subroutine.
6	Reserved	
7	Reserved	
8	SELCH	0 This device is not a SELCH. 1 This device is a SELCH.
9	MEMORY	0 This is not the memory test DCB. 1 This is the memory test DCB.
10	USESELCH	0 Device is not accessed through a SELCH. 1 Device uses a SELCH.
11	DISC	0 Device is not a disc. 1 Device is a disc.
12	Reserved	0 Device is not a floppy. 1 Device is a floppy.
13	Reserved	
14,15	BUFFERS	00 Device has no buffers. 01 Device uses one buffer. 10 Device uses two buffers. 11 Illegal combination.

Table 1 shows the initial FLAG settings for the various DCB's.

TABLE 1 DEVICE/FLAG CROSS REFERENCE

DEVICE	MNEMONIC	FLAG
Console	-	0000
Paper Tape Reader	PTR	0802
Paper Tape Punch	PTP	0402
Paper Tape Reader/Punch	PTRP	0C02
Cassette Tape	CAS	0002
Floppy Disc	FMD	000A
Card Reader	CRD	0001
Line Printer	LNP	0001
A.C. Line Clock	ACL	0000
Precision Interval Clock	PIC	0001
5/16 External Clock	CLK	0000
Eight Line Interrupt Module	INT8	0000
Universal Logic Interface	ULI	0000
Digital Multiplexor	DMUX	0000
Selector Channel	SELCH	0080
SELCH Tester	SLCH	0022
Magnetic Tape	MAG	0022
Disc	DSC	0032
67 or 256 Mb Disc	MSM	0C32
Memory Testing	MEM	0040
Memory Protect	MMP	0000
Special Device	SPCL	0000

The PHASE halfword indentifies the currently active driver routine or the routine to be next activated. It is used as an index into the driver phase table whenever the driver is activated.

The command processor uses the parameter selection flag halfword (PARM) to fill in the DCB. The PARM bits are defined as:

BIT	PARAMETER THAT CAN BE ENTERED
0	Device Address
1	Disc Controller Address
2	SELCH Address
3	Not Used
4	Not Used
5	Cylinder Address Limits
6	Head Address Limits
7	Sector Address Limits
8	Memory Limits
9	May Use Movable Buffer
10-15	Not Used

APPENDIX A
CONSOLE DEVICE DEFINITION

1. The halfword labeled CONTYP (see Program Listing) has the default value for a Teletype type device, GDT, CRT, or Carousel 15, 30, or 35 on a current loop interface. If the console device is different, CONTYP must be changed as:

CONTYP	MEANING
X'0001'	GDT or CRT on a PASLA/PALM interface, strapped for FDX operation at the highest baud rate.
X'0002'	TTY, GDT, CRT, or Carousel 15, 30, or 35 on a TTY current loop interface.
X'0003'	Reserved, interpret as X'02'.
X'0004'	Carousel 300 on PASLA/PALM interface, strapped for FDX operation at the highest baud rate.
X'0005'	TTY, GDT, CRT, or Carousel 15, 30, or 35 on a micro I/O bus current loop interface.
X'0000' and X'0006' through X'00FF'	Reserved, interpret as X'02'.

2. The GDT or CRT, if used on a PASLA/PALM interface, should be strapped for device addresses X'10' and X'11' for the receive and transmit sides respectively. If the base address (X'10') is different, then the halfword labeled PASLADR (see the Program Listing) must be changed.

3. The Teletype type device or current loop interface, if used, should be strapped for device address X'02'. If the address is different, the halfword labeled CLIFADR (see the Program Listing) must be changed.

4. If used on a PASLA/PALM interface, the Carousel 300 should be strapped for device addresses X'10' and X'11' for the receive and transmit sides respectively. If the base address (X'10') is different, then the halfword labeled 'C300ADR' (see the Program Listing) must be changed.

5. If used, the micro I/O bus should be strapped for device address X'C0'. If it is different, then the halfword labeled MICROIO (see the Program Listing) must be changed.

APPENDIX B
CONSOLE COMMAND SYNTAX

When the command processor types an asterisk on the console, a command can be entered. All commands are terminated by a carriage return except for the open next cell command, which is a line feed by itself. A hash or sharp symbol (#) deletes the current command line, allowing the command to be reentered.

1. To select a device or enable a program option, type the command mnemonic, followed by a single space character if parameters follow. If there are no parameters to enter, type a carriage return instead of a space. The optional parameter values are separated by commas and terminated by a carriage return.

   All parameters are positional, separated by commas, with no embedded blanks. All parameter values are given in hexadecimal. To skip a parameter and let it have the default value, type a comma instead of a value. The parameter input can be terminated at any time by entering a carriage return. The default values will be used for any parameters not entered.

   EXAMPLES

   Enable single-precision floating-point testing:

   *FLT (CR)

   Enable double-precision floating-point testing:

   *DFLT (CR)

   Test the paper-tape reader using all default values:

   *PTR (CR)

   Test magnetic tape unit one. Use default device address and SELCH address X'F1'.

   *MAG1 ,F1 (CR)

   For parameters that require two values, the values are separated by a hyphen.

   Test 2.5Mb disc unit one. Use device address X'D6'. Use default values for the controller address, SELCH address. Use the values 0 and X'CA' (decimal 202) for low and high cylinder limits. Use the default values for head and sector limits:

   *DSC1 ,,D6,0-CA (CR)

If only one value is specified without the hyphen, that value is used for both fields (except for memory test limits, which default separately).

2. To remove a device from testing, or to turn off a program option, type the command mnemonic followed by the percent character (%) and a carriage return.

   EXAMPLES

   Delete error message printout:

   *LOG% (CR)

   Stop testing the paper-tape reader:

   *PTR% (CR)

3. If an error is detected when selecting a device, an error message is printed, and the device is not placed on the device service table. Selecting a device that has been previously selected, generates a warning message. The new set of parameters then overrides the previous parameters.

   If an invalid parameter is detected, an error message is printed and the device is removed from the device service table.

APPENDIX C
DEVICE SELECTION COMMAND SUMMARY

Abbreviations:

ADR	Device address
CONTADR	Controller address
SELCH	SELCH address
CYLL	Cylinder low limit
CYLH	Cylinder high limit

NOTE

All cylinders in this range (inclusive) are tested.

HEADL	Head (Track) low limit
HEADH	Head (Track) high limit

NOTE

All heads in this range (inclusive) are tested on each selected cylinder.

SCTRL	Sector low limit
SCTRH	Sector high limit

NOTE

All sectors in this range (inclusive) are tested on each selected head for each cylinder. A seek is performed before each read or write.

LRNL	Logical record number low limit
LRNH	Logical record number high limit

Each device is listed, followed by an example giving all the default parameters.

1. Paper-Tape Reader

```
     ADR
PTR  003      (reader only)
PTP  003      (punch only)
PTRP 013      (reader/punch combination)
```

NOTE

When deleting reader or punch testing, any of the three commands deletes all paper tape testing. To change the type of testing, simply override the old type with the new.

2. Card Reader

```
    ADR
CRD 004
```

3. AC Line Clock

```
    ADR
ACL 06D
```

4. Precision Interval Clock

```
    ADR
PIC 06C
```

5. Line Printer One

```
     ADR
LNP1 062
```

6. Line Printer Two

```
     ADR
LNP2 062
```

7. Cassette Tape One

```
     ADR
CAS1 045
```

8. Cassette Tape Two

```
     ADR
CAS2 045
```

9. Cassette Tape Three

```
     ADR
CAS3 045
```

10. Cassette Tape Four

```
     ADR
CAS4 045
```

11. Magnetic Tape One

```
     ADR,SELCH
MAG1 085,0F0
```

12. Magnetic Tape Two

```
     ADR,SELCH
MAG2 085,0F0
```

13. Magnetic Tape Three

```
     ADR,SELCH
MAG3 085,0F0
```

14. Magnetic Tape Four

```
     ADR,SELCH
MAG4 085,0F0
```

15. Series 30 or 40 Disc One

```
     ADR,CONTADR,SELCH,CYLL-CYLH,HEADL-HEADH,SCTRL-SCTRH
DSC1 0C6, 0B6,0F0,0-0,0-0,0-0
```

16. Series 30 or 40 Disc Two

DSC2 (Same as disc one)

17. Series 30 or 40 Disc Three

DSC3 (Same as disc one)

18. Series 30 or 40 Disc Four

DSC4 (Same as disc one)

NOTE

For Series 40 Discs, Heads 0 and 1 test the removable cartridge and Heads 2 and 3 test the fixed disc. Any range of heads is valid. Always specify the removable disc address.

19. 40 Mb Disc One

```
     ADR,CONTADR,SELCH,CYLL-CYLH, HEADL-HEADH, SCTRL-SCTRH
DSCA 0FC,0FB,0F0,0-0,0-0,0-0
```

20. 40 Mb Disc Two

DSCB (Same as DSCA)

21. 40 Mb Disc Three

DSCC (Same as DSCA)

22. 40 Mb Disc Four

DSCD (Same as DSCA)

23. MSM Disc One

MSM1 (Same as DSCA)

24. MSM Disc Two

MSM2 (Same as DSCA)

25. MSM Disc Three

MSM3 (Same as DSCA)

26. MSM Disc Four

MSM4 (Same as DSCA)

27. Floppy Disc One

```
     ADR,LRNL-LRNH
FMD1 0C1,1-1
```

28. Floppy Disc Two

    FMD2 (Same as FMD1)

29. Floppy Disc Three

    FMD3 (Same as FMD1)

30. Floppy Disc Four

    FMD4 (Same as FMD1)

31. Digital Multiplexor

```
     ADR
DMUX 04B
```

32. Model 5/16 External Clock

```
    ADR
CLK 007
```

33. Universal Logic Interface

```

```

36. Memory

```
    MEML - MEMH
MEM End of Exerciser - Top of memory
```

37. Memory Protect Module

```
    ADR
MPT 0AE
```

APPENDIX D
COMMAND SUMMARY

Program Control Commands

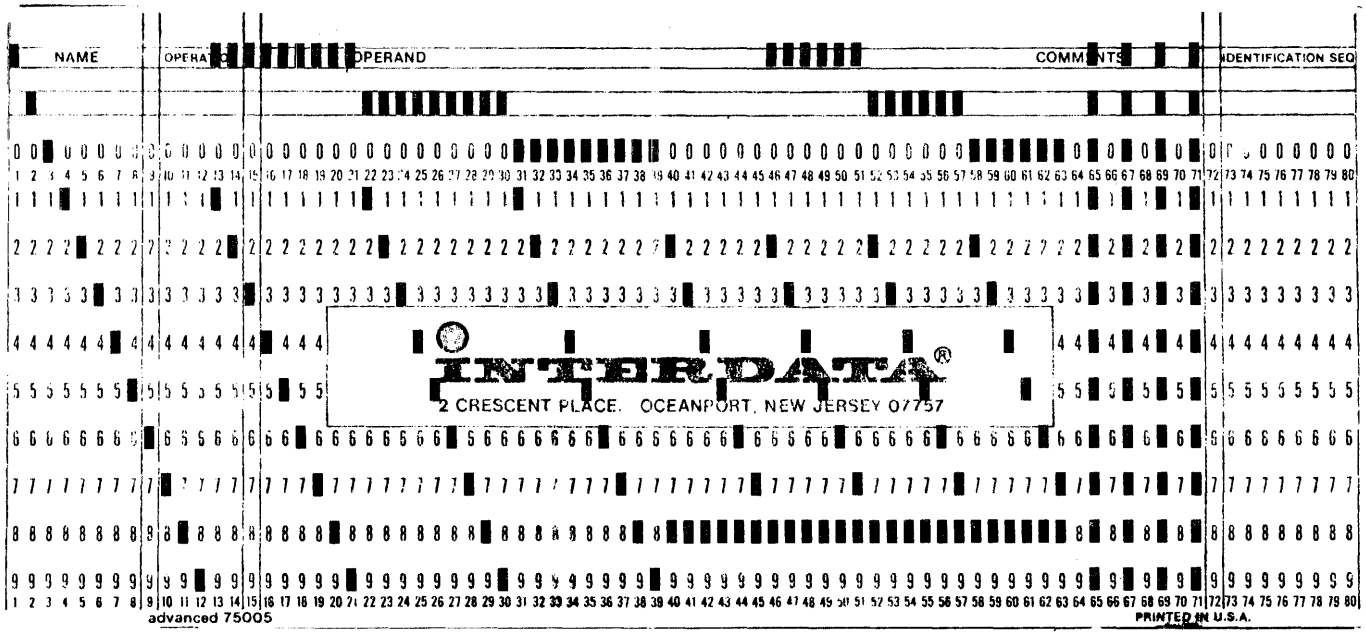
COMMAND	DESCRIPTION
HLT%	Continue testing after error (default)
HLT	Halt on error
LOG%	Disable error printout
LOG	Print error messages (default)
FLT%	Disable single-precision floating-point test (default)
FLT	Enable single-precision floating-point test (default)
DFLT%	Disable double-precision floating-point test (default)
DFLT	Enable double-precision floating-point test
BCK%	Disable background testing. Overrides FLT and DFLT.
BCK	Enable background testing (default)
MOVE	Assign the device just selected to the movable buffer. If the device just selected does not allow use of the movable buffer, an error message is output. If the previous command did not select a device, an error message is output. If the movable buffer assign table is full, an error message is output.
MOVE%	Cancel use of the movable buffer. All devices on the movable buffer assign table are removed.

Other Commands

COMMAND	DESCRIPTION
OPN NNNNN	Print the address and halfword contents of memory location NNNNN.
LF	Typing the line feed key causes the address and halfword contents of the next sequential location to be printed.
REP NNNN	Replace the contents of the open location with NNNN. The address and new contents of the location are printed.
ERR	Prints error summary for those devices currently on the device service table.
DST	Prints the device mnemonics and parameters for those devices currently on the device service table.
OPT	Prints the current switch options. See Program Control Commands.
RUN	Transfers control from the command processor to the device dispatcher. Testing of the selected devices begins.

APPENDIX E
TEST DATA

1. Sample Card Reader Test Card



2. High-Speed Paper-Tape Reader Test Tape 06-136F01M14

   This tape, included in this system exerciser package should be made a continuous loop by the user for testing reader-only systems.

3. Example of line printer output:

```
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<
[ "#%& '()*+,-.10123456789:;<=>?@ABCDEFGHIJKLMNOPQRSTUVWXYZ(/)^<

APPENDIX F
ERROR MESSAGE SUMMARY

*	01				OPSW	OLOC	NPSW	NLOC	Machine malfunction interrupt
*	04				OPSW	OLOC			Unexpected illegal
	05				OPSW	OLOC			Expected illegal did not occur
*	06				OPSW	OLOC			Unexpected SVC
	07				OPSW	OLOC			Expected SVC did not occur
*	12				OPSW	OLOC			Unexpected arithmetic fault
	13				OPSW	OLOC			Expected AFAULT did not occur
	14				OPSW	OLOC			Expected SPFP fault did not occur
	15				EXPECTED		ACTUAL		SPFP data error
	20	DEV	SS						Bad device status
*	21	DEV	SS						Break key on console device
*	32	DEV	SS		OPSW	OLOC			Unexpected I/O interrupt
	33	DEV	SS						Expected I/O interrupt didn't occur
	34	DEV	SS		OPSW	OLOC			SINT failure
	40	DEV	SS	SEL	EXP	ACT			SELCH read address failure
	41	DEV	SS	SEL	EXP	ACT			SELCH write address failure
	44				OPSW	OLOC			Expected DPFP fault did not occur
	45				RESULT				DPFP data error
	50	DEV	SS		EXP	ACT			Data transfer error
	60				EXP	ACT			Load/store multiple error
	61				EXP	ACT	ADDRESS		Memory test error

*Indicates unrecoverable error

DEV	Device Address	3 digits
SS	Status	2 digits
SEL	SELCH Address	3 digits
OPSW	Old PSW (status)	4 digits
OLOC	Old PSW (location count)	4 digits
NPSW	New PSW (status)	4 digits
NLOC	New PSW (location count)	4 digits
EXP	Expected value	4 digits
ACT	Actual value	4 digits
EXPECTED	Expected value	8 digits
ACTUAL	Actual value	8 digits
RESULT	Actual result	16 digits
ADDRESS	Memory address	8 digits

ERROR MESSAGE INTERNAL FORMAT

0	Flags	Error Number
2	Device Number	
4	Status or New PSW or Actual Value 0:15	
6	SELCH Address or New LOC or Actual Value 16:31	
8	Old PSW or Expected Value bit 0:15	
10	Old LOC or Expected Value bit 16:31	

FLAGS - Select which fields are applicable to this error

BIT	FIELDS SELECTED
0	Device number, status
1	SELCH address
2	Old PSW or expected value bits 0:15
3	Old LOC or expected value bits 16:31
4	New PSW or actual value bits 0:15
5	New LOC or actual value bits 16:31
6	Reserved
7	Reserved

OTHER ERROR MESSAGES

FORMAT ERROR	Missing space, comma, or hyphen in a command; or MOVE command follows selection of a device not allowed to use the movable buffer.
SEQUENCE ERROR	MOVE command did not follow a device selection.
DATA ERROR	Nonhexadecimal character received.

SYNTAX ERROR	Illegal device or command mnemonic.
NOT ON TABLE	Attempted deletion of a device that had not been placed on the device service table.
DST OVERFLOW	Device service table overflow. More than 32 devices.
MOVE TABLE OVERFLOW	More than 12 assignments.
NOT ENOUGH SELCH BCBS	All selector channels assigned; no default assignment can be made.
ERROR QUEUE FULL	More than 11 errors to be printed.
PROGRAM ERROR, ERRORLOG	Error queue full detection has failed.
PROGRAM ERROR, ABORT HANDLER	Testing was aborted, but the error queue is empty.
DUPLICATE DEVICE	Device number conflict.
FALSE SYNC	Device timeout.
PROGRAM ERROR, NO MNEMONIC FOR DCB	The error list or DST list command has come up with an invalid DCB address.
