

Features

AutoSense configuration provides flexibility

The AutoSense feature of Quartet/440 TX allows the adapter to detect the maximum line speed of your network automatically. Simply connect the Quartet/440 TX into any existing 10BASE-T or 100BASE-TX network device, no adapter configuration required. For maximum flexibility, this AutoSense feature works with all 10 and 100 Mbits/sec. devices, including those without NWAY line speed negotiation.

Design innovation for Fast Ethernet

There's no limit to how you can use your Quartet/440 TX. Here are just a few examples.

Provide a bridge between standard 10 Mbps and Fast Ethernet.

Each Quartet/440 TX port configures line speed dynamically and automatically—connect one or more of the Quartet's ports to standard Ethernet hubs and printers, and connect the other ports to Fast Ethernet repeaters. The Quartet server bridges between network speeds for you. Choose the best port configuration for your network.

Double the performance with Full Duplex support.
